✿ Project Deployment

“You’ve created a project.”
“But how will others access it?”
“That’s where deployment comes in”

Local Host To Production

<https://localhost:5173>

Local Host

Run and test the application locally before making it publicly available.

GitHub

Store and manage the source code while tracking changes and versions.

Production

Deploy the tested application to the cloud so users can access it online.

MAIN TOOLS INVOLVED

Tools to be used for Deployment

Github

Version Control & Code Management

Stores the project source code and tracks changes using Git

 Vercel

Vercel

Frontend Deployment

Builds and hosts the frontend, making the web application publicly accessible.

 Render

Render

Backend Deployment

Hosts the backend/API and provides the environment required to run server-side code.

Deployment Flow

How to proceed ?

Code on Local System

Develop and test the project on your local machine.

Push to GitHub

Upload the source code to GitHub for version control and deployment.

Deploy Frontend with Vercel

Connect the GitHub repository to Vercel and deploy the frontend.

Deploy Backend with Render

Connect the backend repository to Render and deploy the API/server.

Code Management with GitHub

Process Involved

Create Repository

Create a GitHub repository for the project.

01

Track Changes

Use commits to record changes and maintain different versions of the code.

03

Push Code

Upload the project files from the local system to the repository.

02

Connect to Deployment

Connect the GitHub repository with Vercel and Render for deployment.

04

Frontend Deployment with Vercel

Process Involved

Connect GitHub

Import the frontend repository from GitHub into Vercel.

01

Configure Project:

Select the framework, build settings, and required environment variables.

03

Deploy:

Vercel automatically builds and deploys the frontend application.

02

Go Live:

Vercel generates a public URL and enables automatic redeployment on new GitHub pushes.

04

Backend Deployment with Render

Process Involved

Connect GitHub

Select the GitHub repository containing the backend code.

01

Build & Deploy

Render installs dependencies, builds the application, and starts the backend server.

03

Configure Service

Choose the runtime, build command, and start command required to run the backend.

02

Live Website

Render provides a public URL through which the frontend can communicate with the backend.

04

Connecting Frontend & Backend

how frontend shows information
in it's dashboard

01

Frontend sends API Request

The deployed frontend on Vercel sends requests to the backend.

02

Backend receives Request

The backend deployed on Render processes the request.

03

Backend communicates with Database

The backend fetches or updates the required data.

04

Response sent to Frontend

The backend sends the result back to the frontend for display.

Deployment Workflow

From Local Host To Production

Code

Develop and test the project locally.

Tools

GitHub, Vercel & Render streamline the deployment process.

Deployed

Make the application live and accessible to users.

HOW TO PRESENT YOUR HACKATHON PROJECT TO JUDGES

HACKSTART • WORKSHOP

Clear story. Confident delivery. A demo
judges can follow.

SESSION

HACKSTART

FORMAT

WORKSHOP

FOCUS

PRESENTATION

NOT EVERY HACKATHON IS THE SAME

Match the story to the judging logic.

SIH-STYLE

Problem → Solution →
Implementation → Impact

PROBLEM

What problem statement are you solving?

SOLUTION

What did you build to address it?

IMPLEMENTATION

How does the technology make it work?

IMPACT

What changes if this succeeds?

OPEN / THEME-BASED

Problem → Why it matters →
Solution → Demo → Impact

PROBLEM

What needs attention?

WHY IT MATTERS

Why should judges care now?

SOLUTION + DEMO

What did you make, and can we see it work?

IMPACT

Who benefits, and what is possible next?

CONFIDENCE COMES FROM CLARITY

01 Know the deck

Understand every slide before you enter the room.

02 Look up

Make eye contact. Let your voice lead.

03 Slow down

Use natural gestures and pause after key points.

04 Stay honest

If you do not know, say so clearly.

DON'T OVEREXPLAIN THE POINT

THE TRAP

Read every line

The slide becomes the speaker.

Repeat yourself

The same point arrives three times.

Fill every second

Silence feels like failure, so the story expands.

Hide behind jargon

Complex words replace a clear explanation.

THE BETTER MOVE

YOUR PPT SUPPORTS
YOUR EXPLANATION. IT
SHOULDN'T REPLACE
IT.

Explain the important idea

Add the context judges need

Stay concise and let questions open
the detail

READ THE SLIDE. DON'T READ THE SLIDE OUT LOUD.

01

Look

Scan the slide before you speak.

02

Understand

Find the one message that matters.

03

Explain

Use keywords as prompts.
Speak naturally.

04

Move on

Keep attention on you and the idea.

BEFORE YOU FACE THE JUDGES

- **Problem statement** – clear in one sentence
 - **Solution inside-out** – you can explain how it works
 - **Tech stack** – you know why each part is there
 - **Teammate contributions** – everyone can name their role
 - **Full presentation practice** – not just a slide click-through
- **Demo practice** – the handoffs and failure points are known
 - **Likely questions** – you have rehearsed the hard ones
 - **Backup demo** – the story still works if the live path fails
 - **Time limit** – the ending fits the room
 - **Clear final message** – judges know what to remember

PRACTICE THE PRESENTATION. DON'T JUST PRACTICE THE PPT.
